

MEMORANDUM

TO: Management

FROM: Sales Team

DATE: 18 March 2026

SUBJECT: Key Operational Challenges with Sales CRM System

Introduction

This memo outlines critical operational challenges currently being experienced with the Sales CRM system. These issues are affecting lead management efficiency, response time, and overall sales productivity.

Key Issues Identified

1. Lack of Automated Lead Response

- The CRM system does not automatically send acknowledgment or introductory emails when new leads are received.
- This delays initial engagement and reduces response efficiency.

2. Poor Mobile Synchronization

- The system is not properly synchronized with mobile devices.
- Sales consultants are unable to access or manage leads effectively while on the move, limiting productivity and responsiveness.

3. Ineffective Reminder and Follow-Up System

- Scheduled reminders and follow-up alerts are either delayed or not triggered.
- This affects timely client engagement and consistent follow-through.

4. Limited Call and Engagement Tracking Functionality

- The system does not support seamless call logging or direct call integration.
- Consultants face challenges updating client interactions, triggering reminders, and maintaining a clear chronological activity history.

5. Duplicate Lead Allocation

- Multiple consultants (in some cases more than three) are assigned to the same lead.
- This creates confusion in client communication, reduces accountability, and increases the risk of duplicated or inconsistent follow-ups.
- It negatively impacts professionalism and overall client experience.

6. Lack of Lead Privacy, Data Integrity and Ownership Control

- Consultants are able to edit leads and captured updates on other consultants' leads within the system.
- This compromises lead confidentiality and undermines ownership of prospects.
- The absence of access control increases the chance of alteration of lead updates by other consultants on the CRM, as exclusivity is not protected.
- There is a need for role-based access controls to ensure leads are secure and only accessible to authorized users.

7. Inability to Perform Core System Functions

- Consultants are unable to effectively create, assign, and manage tasks within the system.
- Consultants are also unable to generate Reservation Forms from the system even after capturing all necessary client details.
- Key functions such as setting reminders, updating activities, and tracking progress are limited or non-functional.

8. Lack of Activity Time-Stamping

- The system does not reliably capture critical activity timestamps, including: date a lead was engaged, time of first contact, and follow-up timelines.
- This limits performance tracking, reporting accuracy, and accountability.

9. Insufficient Customer Data Visibility and Reporting

- Consultants cannot view a comprehensive sales journey of a customer on the interface, including all property details owned by the client.
- Customer installment payment records are not updated or viewable on the CRM; consultants must contact the Finance department separately for payment updates, balances, and related information.
- Multiple purchases by the same client result in double entries of customer details, leading to data duplication and inconsistency.

10. Overly Complex and Cluttered User Interface

- The CRM interface is crowded with too many buttons and features, many of which are not currently in use.
- This reduces usability, increases the learning curve, and slows down workflow efficiency.
- A simplified, intuitive, and user-friendly interface is required.

Impact on Operations

These challenges collectively result in:

- Delayed response to leads
- Reduced conversion rates
- Inefficient follow-up processes
- Poor user experience for consultants
- Weak lead ownership and accountability

- Compromised data integrity and customer record accuracy
- Potential loss of high-value prospects

Recommendation

We recommend a comprehensive review of the CRM system by a technical consultant to:

- Diagnose and resolve existing system gaps
- Implement automated lead response functionality
- Improve mobile synchronization and usability
- Streamline the user interface for better efficiency
- Strengthen lead allocation controls and enforce role-based access restrictions
- Enable generation of Reservation Forms directly from the system
- Integrate real-time payment and customer data visibility for consultants
- Resolve duplicate customer record entries on multiple purchases
- Enhance task management, tracking, and reporting capabilities

Conclusion

Addressing these issues is critical to improving sales efficiency, strengthening client engagement, and maximizing revenue opportunities. We look forward to management's prompt support in resolving these challenges.
